

FRENIC MEGA

Maximum Engineering for Global Advantage

3-phase 400 V 0.4 to 630 kW

High Performance Multifunctional Inverter

The performance reaching the peak in the industry

FRENIC-MEGA is a high performance, multifunctional inverter Fuji Electric has developed by gathering the best of its technologies.

Now it is ready to answer your needs.

Maximum Engineering for Global Advantage

What is FRENIC-MEGA and what are the advantages?

- Able to drive induction and permanent magnet synchronous motors
- Built-in EMC filter as standard
- Ability to handle up to 3 simultaneous option cards (3 ports)
- Keypad with a USB connector
- Built-in braking transistor up to 22 kW (standard) and 160 kW (option)
- Safety enable input
- Full network support
- 4 complete motor maps

Improved control performance

Motor control methods: PG vector control, sensorless vector control, dynamic torque vector control, and V/f control.

Improved performance of current response and speed response (vector control)

Improved durability in overload operation

- HD (high duty) spec: 200% for 3 sec / 150% for 1 min
- LD (low duty) spec: 120% for 1 min

Lower maintenance

Maintenance warning output signal

Use of parts with a longer life cycle

Best vector control for the general-purpose inverter in its class

Maximizing the performance of a general-purpose motor by using closed loop vector control

Effective in providing highly accurate control for applications such as offset printing, hoisting, winding and wire drawing

- Speed control range: 1:1500
- Speed response: 100 Hz
- Speed control accuracy: $\pm 0.01\%$
- Current response: 500 Hz
- Torque accuracy: $\pm 10\%$

Maximizing the performance of a general-purpose motor Sensorless vector control

Useful for applications which require a high starting torque, such as mixers, extruders and conveyors

- Speed control range: 1:200
- Speed response: 20 Hz
- Speed control accuracy: $\pm 0.5\%$

- Current response: 500 Hz
- Torque accuracy: $\pm 10\%$
- Zero speed torque: $100\% \pm 20\%$

Fuji's original dynamic torque vector control has further evolved

Dynamic torque vector control has been improved to achieve a high starting torque of 200% even at a low-speed rotation of 0.3 Hz. This is a new method introduced by Fuji Electric.

Permanent magnet synchronous motor control

FRENIC-MEGA can drive permanent magnet synchronous motors, both sensorless (open loop) and with speed feedback (closed loop).

Improved durability during overload condition

The inverter performs short-time acceleration and deceleration with the maximum capacity by achieving better time rating of the overload ratings compared with our previous models. This improves the operation efficiency of the equipment such as a cutting machine or conveyors.

Overload capability: 200% for 3 sec. and 150% for 1 min.

The standard model is available in two specifications concerning the operation load.

Classification	Overload current rating	Major use
HD (High duty) spec	200% for 3 sec, 150% for 1 min	Operation under heavy load
LD (Low duty) spec	120% for 1 min	Operation under light load

Expanded capacity for the brake circuit built-in models

A brake circuit is built in the 22 kW or smaller models as a standard feature. These inverters are suitable to be used in machines with regenerative load such as vertical conveyance machines. The 7.5 kW or smaller models also incorporate a braking resistor

From 30 kW to 160 kW models in 400 V series built-in brake circuit can be manufactured on request.

Dedicated brake control function

Torque values are now included in the brake releasing conditions, which ensures that motor torque is generated, and therefore brake signal is more reliable.

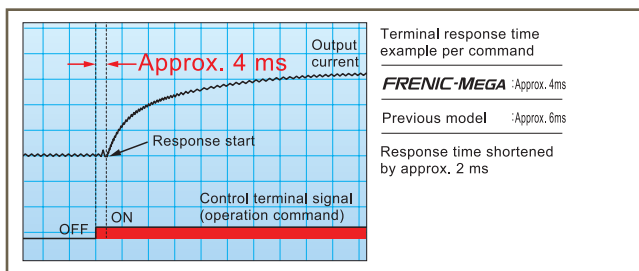

Improved reaction to the fluctuation of impact load

When a large load fluctuation occurs, the inverter provides the fastest torque response in its class. It controls the flux to minimize the fluctuation in the motor speed while suppressing the vibration. This function is best suited for the equipment that requires stable speed such as a cutting machine.

Quicker response to the operation commands

The terminal response to the operation commands has had an established reputation. FRENIC-MEGA has further shortened this response time, achieving the industry-top response time. This function is effective in shortening the time per cycle and effective for use in the process including frequent repetitions.

Double rating

HD (High Duty) Specification

- Overload capacity 150% 1min 200% 3s
- Inverter capacity = Motor capacity
- General use

LD (Low Duty) Specification

- Overload capacity 120% 1min
- The motor capacity can be one size larger than the inverter capacity
- For application with light load (fans, pumps or centrifugal machines)

Support for simple maintenance and Improved working efficiency

Basic keypad TP-E1U

Built-in USB port (mini B connector): allows easy connection of a personal computer equipped with loader software.

Able to save:

- 1 complete function data set.
- Inverter operation data.

When this keypad is connected to the inverter, all the Loader software features can be used:

- Editing, comparing, and copying the function code data
- Real-time operation monitor
- Alarm history (indicating the latest four alarms)
- Maintenance information
- Real time trace
- Historical trace

Can be disconnected from the inverter and used standalone, connecting the keypad to a personal computer equipped with loader software (using USB connection), allowing to check the data saved in the keypad away from the factory site (office).

Multifunction Keypad TP-G1-J1

Features

- LED and LCD display
- Function description in clear text (multi languages)
- Able to save 3 complete function sets
- Compatible with FRENIC Eco and FRENIC Multi
- Menu 0 can be defined
- I/O Check menu
- Operation monitor menu
- Communications debug menu

Prolonged service life and improved life judgment function

Designed life 10 years

For the various consumable parts inside the inverter, their designed lives have been extended to 10 years, which also reduces maintenance downtime.

- Main circuit capacitor: 10 years
- Electrolytic capacitor on PCB: 10 years
- Cooling fan: 10 years

The parts life is estimated on condition that the inverter is used at an ambient air temperature of 40°C and under the load rate of 100%(HD spec) or 80%(LD spec).

Full support of life warnings

The inverter is loaded with the functions for facilitating the maintenance of the equipment.

Consideration for environment

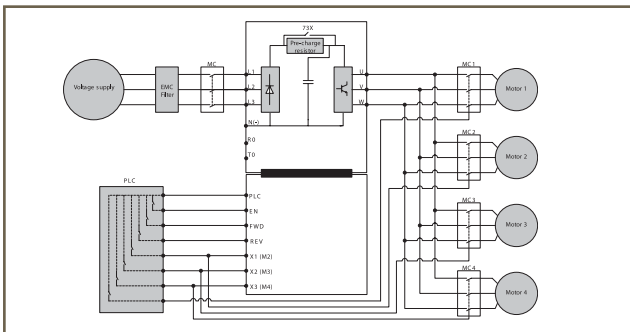

Enhanced resistance to environmental impact

Resistance to the environmental impact has been enhanced compared with conventional inverters.

- (1) Enhanced durability of the cooling fan, reducing environmental impact
- (2) Adoption of copper bars plated with nickel (Ni) or tin (Sn)

4 complete motor maps

Each motor (1-4), can be configured by its own function group, and the control mode for each motor (1-4) can be selected independently. Each motor can also be tuned independently.

Complete PID control functions

1. Unbalanced, bumpless function

2. Anti-reset windup function has been added

3. Stops operation at a slow flow rate

Servo lock function

- The inverter holds the position of the motor shaft
- Only available when using speed feedback (closed loop)
- To activate servo lock function, a digital input programmed with (LOCK) function must be active
- The inverter can indicate servo lock completion by a digital output programmed with (PSET) function

Loader Software

- Efficient data management: editing, comparing or copying function code data
- Test run, motor auto-tuning: aid at startup
- Operation monitor, real-time and historical tracing, failure monitor, multi-monitor: aid for maintenance and defect analysis
- Operation on Windows 2000 and XP guaranteed

Fieldbus Options

ProfiBus DP interface
CANopen interface
DeviceNet interface
T-Link interface
SX Bus interface
CC-link interface
Etc.

(*1) Fuji's 4-pole standard motor

(*2) Rated capacity is calculated by assuming the output rated voltage as 220 V for three-phase 200 V series and 440 V for three-phase 400 V series.

(*3) Output voltage cannot exceed the power supply voltage.

(*5) The auxiliary power input is used as an AC fan power input when combining the unit such as high power factor PWM converter with power regenerative function. (Generally not used.)

(*6) Interphase voltage unbalance ratio[%] = (max. voltage [V] - min. voltage [V]) / 3-phase average voltage [V] × 67 (See IEC61800-3.) Use the DC reactor (ACR: optional) when used with 2 to 3 % of unbalance ratio.

(*7) The value is calculated on assumption that the inverter is connected with a power supply capacity of 500kVA (or 10 times the inverter capacity if the inverter capacity exceeds 50kVA) and %X is 5%.

(*8) Obtained when a DC reactor (DCR) is used.

(*9) Average braking torque obtained by use of a motor. (Varies with the efficiency of the motor.)
